

ROOF CONDITION-OF-RECORD • FOR P&C UNDERWRITING & CLAIMS

JINKI.

As you can defend to a
regulator **and in court.**

Instrument-grade roof condition — captured from the air,
governed by design, delivered as a **defensible record.**

MID-ATLANTIC • FOUNDER-DIRECT • METHODOLOGY-LED

02 · PROBLEM Roof is the leading loss driver — and the most-disputed line

ASSESSED LATE · INDEFENSIBLY

The roof drives the loss and drives the dispute — yet its condition is rarely on file in a form that holds up.

~40–43% of homeowners losses are wind & hail — the #1 driver, and roof-first. III, 2023–24	~25% of residential claim value is roof-related — roughly \$31B of 2024 costs. Verisk, 2024	~38% of US roofs read moderate-to-poor in aerial condition data. Verisk, 2025
--	---	---

Roof condition is assessed late, inconsistently, or in a form that doesn't hold up — so a thin file becomes a **disputed claim**.

03 · COST The gap is expensive today — and worsening

UNDERWRITING & CLAIMS LENS

Unpriced roof condition costs on both desks — it mis-selects the book, and it litigates the claim.

UNDERWRITING LENS	CLAIMS LENS
– Moderate-to-poor roofs carry ~60% higher loss cost. Verisk RCS, 2025 – Aging (~20-year) roofs are materially likelier to claim — practitioner estimate, directional, wide range. – Condition priced by age, not seen, is adverse selection you can't observe.	– Loss-adjustment expense runs ~10–15% of losses paid. IRMI – Disputes concentrate: FL has generated a large majority (~70%+) of US homeowners-insurance litigation while representing a small share of claims. III / FL OIR, ~2021–22 – A thin file is what turns a covered loss into a contested one.

04 · REGULATION A forcing function is arriving on a clock

AI IN UW & CLAIMS

Regulators are converging on the same rule: AI in underwriting and claims must be explainable and governed.

AI in underwriting and claims now has to be **explainable and defensible** — documented governance, not a black box.

05 • CATEGORY What Jinki is

THE UNIT OF VALUE

Jinki is a roof / property-condition **specialist** — not a generalist aerial vendor.
The unit of value is a **condition-of-record**: instrument-grade, geolocated, time-stamped, defensible.

06 · METHOD Capture

01 / METHOD · CAPTURE

DISCIPLINED, NOT OPPORTUNISTIC

Aerial thermal + visual, flown in the **solar window** — when thermal contrast (ΔT) is real, not when the calendar says.

Low sun-angle loads the roof; trapped moisture and delamination hold heat and separate from the background. Capture outside that window reads flat.

SOLAR GEOMETRY BOUNDS THE FLIGHT ·
 ΔT DRIVES THE DECISION

THE HUMAN-IN-THE-LOOP GATE

Every anomaly is ranked **SEV-1/2/3** and confidence-scored. Findings **under 0.80** route to a **logged human review**; at or above, they auto-clear.

The gate is the governance control — the line a regulator can see, and the reason a weak finding never lands unchecked.

EVERY FINDING SCORED ·
THE 0.80 GATE IS THE CONTROL

A DEFENSIBLE ARTIFACT, ON A CLOCK

A geolocated, time-stamped **condition brief**, on a **48-hour target** — pre-season baseline, post-event documentation, an underwriting condition input, and renewal-time re-assessment.

Every finding carries its severity, its confidence, and its provenance — so the record states what it rests on.

GEOLOCATED · TIME-STAMPED ·
48-HOUR TARGET

09 • THE WEDGE The Governance Chain

CREDENTIAL → CONTROL → RECORD

Your credentials, wired to the controls that make a finding hold up — **defensible to a regulator and in court.**

10 · DEFENSIBILITY Why it holds up

TO A REGULATOR · IN A DEPOSITION

A condition-of-record earns its name by what it survives — here is the scrutiny it is built to withstand.

- **A deposition or cross-examination** — chain-of-custody and capture metadata (provenance, geolocation, time-stamp) travel with every dataset, **producible on demand** when opposing counsel asks where a finding came from.
- **A regulator or NAIC AI exam** — outputs are explainable and severity-ranked, each stating how it was reached and carrying its confidence, **built for review**, not a black box to defend.
- **An appraisal or coverage dispute** — the record states what it rests on, so imagery is **one input, never the sole basis** — and it **augments your people, never replaces their judgment**.

THE STANDING RULE

Imagery is one input, never the sole basis for a decision — the record states what it rests on, so it holds up to a regulator or in court.

11 · THE LIVING RECORD The Roof Ledger

BASELINE → CADENCE → FLAGGED Δ

CONDITION IS A FILE, NOT A SNAPSHOT

One scan is a data point. Jinki opens a condition-of-record at baseline and accrues it on cadence — so you watch a roof change in **velocity**, not discover it failed at the claim.

The file is version-controlled: baseline → on-cadence re-scans → post-event capture → a **flagged Δ** — the entry that reprices a renewal or documents a loss.

12 · DIFFERENTIATION How Jinki is different

SAME FLIGHT · A DIFFERENT ARTIFACT

The aerial pass looks familiar. What you receive — and can stand behind — is not.

TYPICAL AERIAL REPORT WHAT THE MARKET SHIPS	JINKI CONDITION-OF-RECORD WHAT HOLDS UP
A photo / measurement dump — raw output, unreviewed	A defensible record — provenance and reasoning attached
A generalist covering every asset class	A roof / property specialist — one domain, deeply
Ungoverned AI — a black box, no accountable owner	An AI-governance-credentialed founder behind the method
A one-off snapshot, obsolete on delivery	A living, longitudinal file — re-scanned on cadence
A sales handoff — SDRs, tiers, account managers	Founder-direct — the person who signs the standard

13 • FIT Where it fits your book

UNDERWRITING × CLAIMS

One condition-of-record, two desks. The same defensible file enters the book at every stage — on the underwriting side and the claims side.

BOOK STAGE	UNDERWRITING	CLAIMS
01 New business	Pre-bind condition input — price the roof you can see, not just its age.	A baseline on file, before any loss.
02 Renewal	Re-scan re-price — condition change, not a static age assumption.	Documented change history for the account.
03 Post-event	Portfolio event triage — where to look first.	Time-stamped post-event documentation.
04 Claim	A loss-cause signal to inform the file.	A defensible severity + confidence record.
05 Litigation	—	A chain-of-custody exhibit that holds up.

Start with a single roof.

One scoped assessment on one property — enough to read the method, the record, and the standard we sign to, before anything scales.

Part 107	\$5M / op	COI	Add'l	Mid-Atl.
FAA CERTIFICATED	LIABILITY COVERAGE	AVAILABLE PRE-CONTRACT	INSURED NAMING AVAIL.	OPERATING REGION

TRUST THROUGH TRANSPARENCY

What we are, plainly.

- **Methodology-led** — the standard and the governance come first; the book of scans follows.
- **Zero client scans to date.** No case studies, no named accounts — we will not manufacture either.
- **SOC 2 is on the roadmap, not attained.** Stated as a target, never as a badge we hold.
- Figures on these slides are **targets**, and the schematics are **illustrative** — not measured Jinki results.

15 · **STANDING** The person who signs the standard

FOUNDER · VERIFIABLE CREDENTIALS

Adnan Abdillahi

FOUNDER & CEO

ex-Deloitte cyber risk senior consultant

“The method is built so every finding is one I can defend in writing — the standard I sign to.”
